Hello all,

some students of my university and i
bought a server for our lan-partys. We made a normal cs-server on it. Now we tried to make a
wcs server on it, but it didn't worked. We tried a introduction from the internet with the same
result. Maybe the admin, who made the TWK WCS Server can give me a guidance how to
make it, or can give me a link of a website where it's explained well (in englisch or in
german).

Thank you

WCS
must be enabled in the threddsConfig.xml configuration file before it can be used. This is done
by adding an allow element to the WCS element as follows:

> true

 ...

Once WCS is enabled, datasets
can be configured to have a WCS access method in the TDS catalog configuration files similar
to how other services are configured. The service element's serviceType and base attribute
values must be as follows:
